Dear friend,

I code or read about code all the time. That is how I live. Or to put it differently; I do not use auto-formatters and the best feeling in the world is when I get to break backward compatibility in order to make a better API.

I lost my virginity to a Microsoft-stack a long time ago. Then I cheated with PHP quite a bit. Eventually I married Java and I have remained faithful for many years. Most of the time has been spent digging around on the back-side of web development, but I am by no means new to the front-end.

I can enumerate buzzwords all day. But that is totally boring.

My strong suite is Java of which I have two Oracle certifications and the honor to be labeled the world's second best programmer in 2016 by the multinational employer I had at the time (the test was limited to their employees).

I had a huge falling down in 2018 from working too many years without much technical progress, so I bought a camper van and a cat, hit the road and became nomadic. Today, I live life as a free man. I wander the world and I get to code however much I want too 😄

Sincerely,

Martin A.
