Dear friend,

I read and code all the time. That is how I live. Let's just say that I do not use auto-formatters and the best feeling in the world is when I get to break backward compatibility in order to make a better API.

I lost my virginity to a Microsoft-stack a long time ago. Then I cheated with PHP quite a bit. Eventually, I married Java (I still day dream of C# to be honest). Most of the time has been spent digging around on the back-side of web development, but I am by no means new to front-end.

I can enumerate buzzwords all day. But that is totally boring.

My strong suite is Java of which I have two certifications and the honor to be labeled the world's second best programmer in 2016 by the employer I had at the time (the test was limited to their employees).

What I – currently! – suck at is the new kids like NoSQL and microservices. I know a bunch of theory, but I do lack the practical experience. This I hope you can give me 😊

Okay, why did I stay such a short time with my last employer?

The short story is that they fuct up pretty bad. I have a great relationship with the end customer Klarna, but my employer on the paper was a little bit of a joker. When I found out that I had no health insurance and I was technically speaking being in Germany illegally, that's when I left.

I bought a camper van and a cat, then I hit the road. Today, I live like a free man. I wander the earth and I get to code however much I want too 😊

Sincerely,

*Martin Andersson*
